Below is a step-by-step guide to performing blood smears for diagnostic use. Examination of blood smears is an integral part of haematological testing. Blood smears are useful for examining cell morphology and identifying blood-borne parasites. Remember to include a detailed history and description of lesions on the Animal Health Laboratories (AHL) submission form. For more information on blood smears, contact AHL on +61 0(8) 9368 3351. Email AHL@agric.wa.gov.au for copies of other diagnostic reference guides - A visual guide to a ruminant animal post-mortem, Basic diagnostic sampling protocol – livestock, Brain removal techniques and A visual guide to a chicken necropsy.

Perform blood smears when you suspect:
- blood-borne protozoal or mycoplasmal conditions
- haemolytic conditions
- anaemia
- haematologic neoplasia.

Equipment required for performing blood smears:
- microscope slides with frosted ends for writing on
- spreader slide – use a specific spreader slide with bevelled edges, or a second clean microscope slide
- capillary (microhaematocrit) tubes
- pencil to label the slides
- blood collected in an EDTA tube
- pot of sterile water to clean the spreader slide between uses.

Perform blood smears when you suspect:
- blood-borne protozoal or mycoplasmal conditions
- haemolytic conditions
- anaemia
- haematologic neoplasia.

Equipment required for performing blood smears:

- spreader slide – use a specific spreader slide with bevelled edges, or a second clean microscope slide
- capillary (microhaematocrit) tubes
- pencil to label the slides
- blood collected in an EDTA tube
- pot of sterile water to clean the spreader slide between uses.

Top tips for making good smears:
Making great blood films takes practice; don’t be discouraged by less than perfect smears. Submit all blood smears, perfect or otherwise, as areas of the film may be suitable for examination.
- Collect blood in an EDTA tube and make the smears when back at the clinic.
- Use clean, high-quality microscope slides.
- Aim for a blood droplet size of 4mm diameter.
- Optimise spreading speed for length and a good feathered edge.
- Hold the spreader slide at 30-40 degrees to achieve optimal smear length.
- Maintain even contact throughout the spreading motion.

Master your blood smear technique (cont.)

### Troubleshooting blood smear errors

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solutions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short smear</td>
<td>• Use a larger droplet of blood.</td>
</tr>
<tr>
<td></td>
<td>• Decrease the angle of the spreader slide.</td>
</tr>
<tr>
<td></td>
<td>• Decrease the speed of the spreader slide.</td>
</tr>
<tr>
<td>Long smear / no feathered edge</td>
<td>• Use a smaller drop of blood.</td>
</tr>
<tr>
<td></td>
<td>• Increase the angle of the spreader slide.</td>
</tr>
<tr>
<td></td>
<td>• Increase the speed of the spreader slide.</td>
</tr>
<tr>
<td>Thick smear</td>
<td>• Use a smaller drop of blood.</td>
</tr>
<tr>
<td></td>
<td>• Decrease the angle of the spreader slide.</td>
</tr>
<tr>
<td></td>
<td>• Decrease the speed of the spreader slide.</td>
</tr>
<tr>
<td>Thin smear</td>
<td>• Use a larger drop of blood.</td>
</tr>
<tr>
<td></td>
<td>• Increase the angle of the spreader slide.</td>
</tr>
<tr>
<td></td>
<td>• Increase the speed of the spreader slide.</td>
</tr>
<tr>
<td>Smear has waves and ridges</td>
<td>• Maintain even contact and a smooth motion.</td>
</tr>
<tr>
<td></td>
<td>• Increase the speed of the spreader slide.</td>
</tr>
<tr>
<td></td>
<td>• Relax the wrist, reduce downward pressure on the spreader slide.</td>
</tr>

### Infectious diseases in Australia diagnosed by blood smear:

<table>
<thead>
<tr>
<th>Disease</th>
<th>Species</th>
<th>Transmission</th>
<th>Disease status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anaplasmosis</td>
<td>cattle</td>
<td>tick-borne</td>
<td>endemic – northern Australia</td>
</tr>
<tr>
<td>Babesiosis</td>
<td>cattle</td>
<td>tick-borne</td>
<td>endemic – northern Australia</td>
</tr>
<tr>
<td>Mycoplasma ovis (eperythrozoonosis)</td>
<td>sheep</td>
<td>iatrogenic, blood-sucking insects (midges, mosquitoes, flies)</td>
<td>endemic</td>
</tr>
<tr>
<td>Bovine anaemia due to Theileria orientalis group (BATOG)</td>
<td>cattle</td>
<td>tick-borne</td>
<td>endemic in eastern Australia – first diagnosed in WA in 2013</td>
</tr>
</tbody>
</table>

Contact the Animal Health Laboratories (AHL) duty pathologist on +61 (0)8 9368 3351 or your local field veterinary officer to discuss the case, sampling and charge exemptions.

---

### Blood smears – common errors

The blood droplet on the left is too big and will result in a thick smear. The blood droplet on the right is the preferred size.

**Smear technique. Left to right:**

- slide 1 – perfect smear
- slide 2 – smear technique interrupted in middle
- slide 3 – smear was skewed
- slide 4 – blood droplet too thick
- slide 5 – smear too short.

---

**Bovine erythrocytes infected with protozoal parasites from the Theileria orientalis group.**

The parasite is known as a piroplasm when it is within an erythrocyte. Piroplasms appear in erythrocytes from day 10 post-infection. Naïve, young, pregnant or immunocompromised animals may develop severe anaemia and mortalities can be as high as 30 per cent in a herd.

**Haemaphysalis longicornis (common bush tick)**

Ticks are vectors for many protozoal and mycoplasmal parasites. For *Theileria* spp. transmission in the tick is known to be trans-stadial or life stage-to-life stage. A larva or nymph stage tick transmits the parasite to the next animal it feeds on. Trans-ovarial transmission (transmission from infected females to their larvae) does not occur. Control of ticks and good sanitation when using needles and surgical equipment minimises the introduction of these infectious parasites into naïve populations.
